Carbide drills | Thread cutting tools

XDrill® carbide drills

- **High-performance carbide drills for machining various types of steel**
  Particularly suitable for steels up to Rm 1,500 N/mm^2
- **Significantly longer tool life at increased feed rates and higher cutting speeds**
  Thanks to high-stability cutting edge geometry, ultra-fine-grain carbide and extremely hard coating
- **DURO-X wear-resistant, nano multi-layer hard coating**
  The temperature-resistant coating, specially developed for high-performance machining, ensures outstanding process security
- **Machining time reduced by more than 50%**

XDRILL®

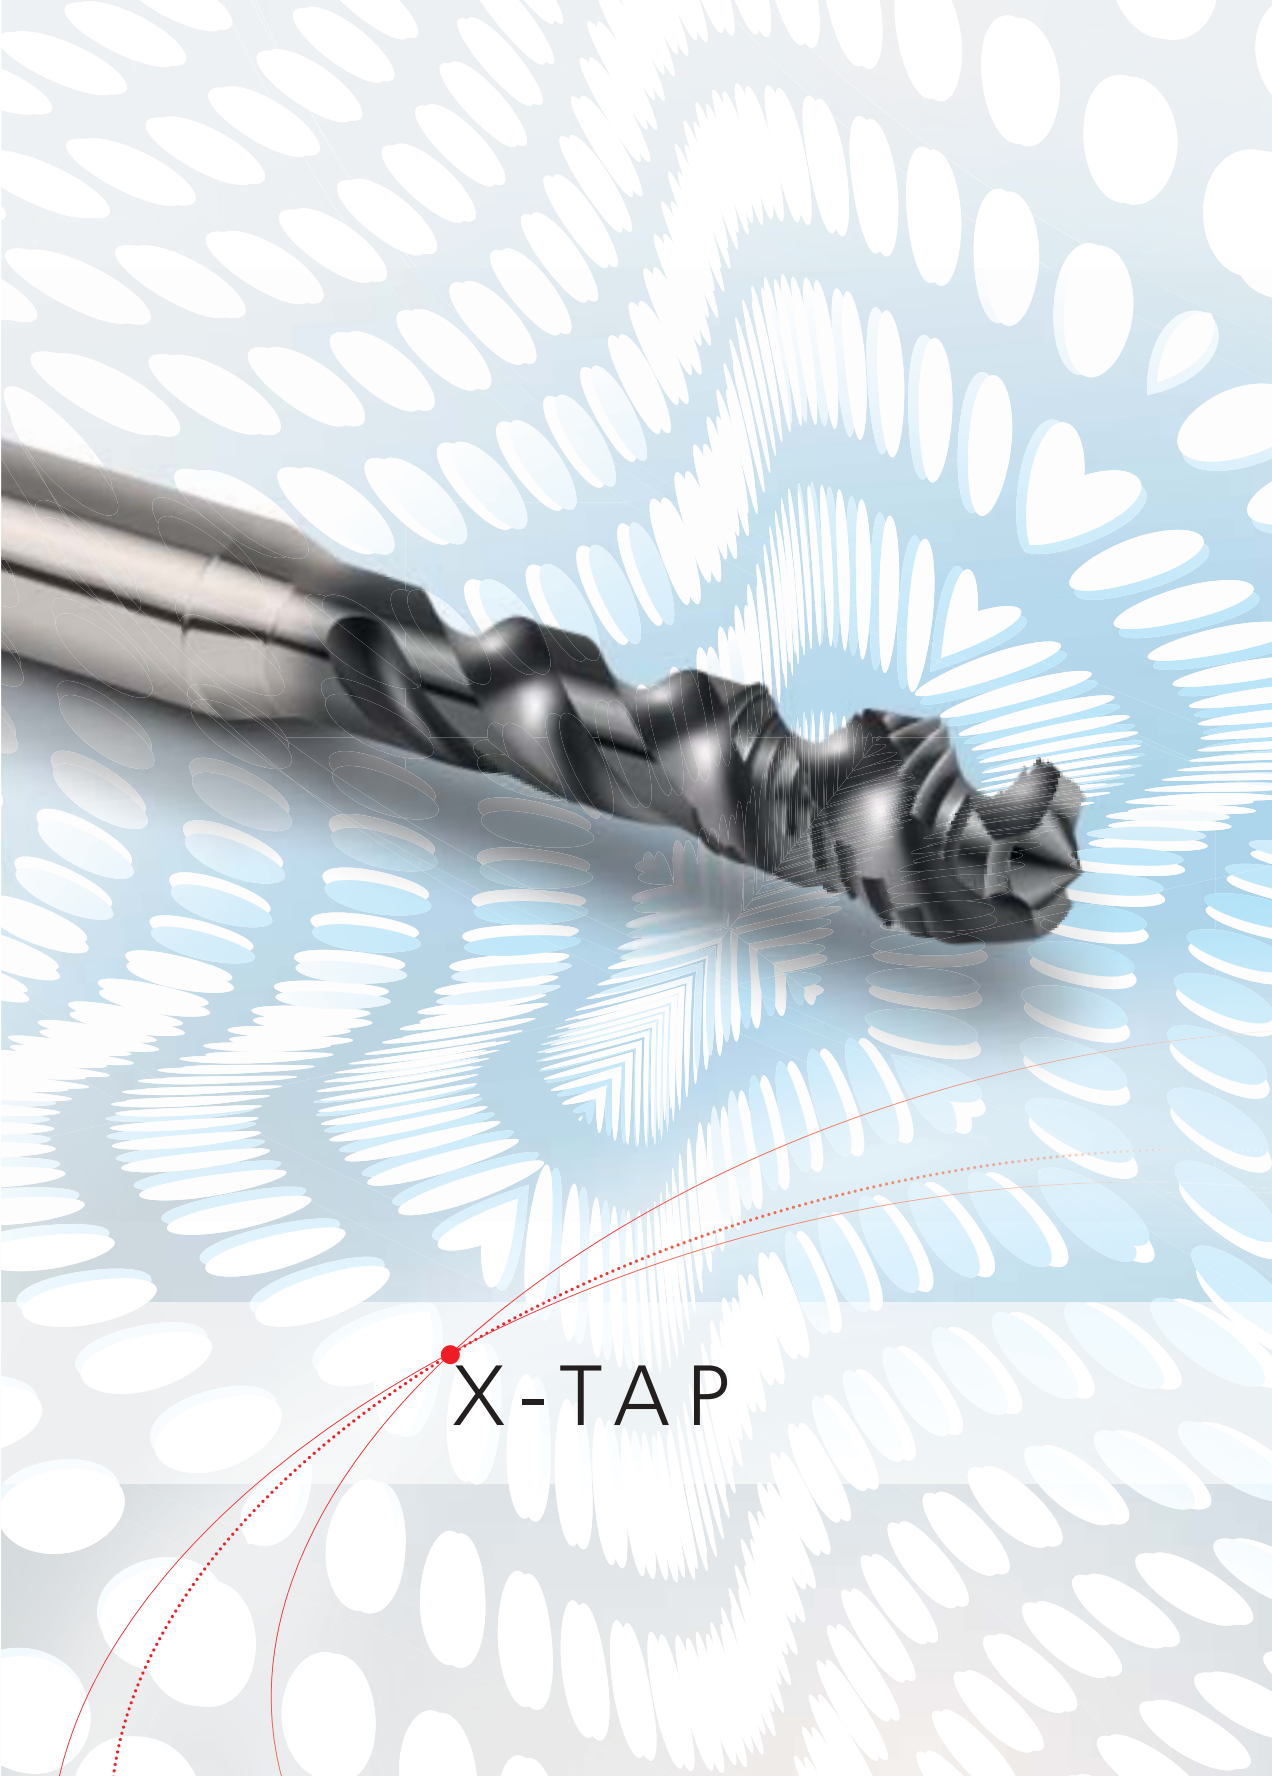
Supradrill® U carbide drills

- **Universal machining of various types of steel**
  Safe, reliable drilling processes in steel and stainless steel
- **Comprehensive range for a broad spectrum of drilling applications**
  Basic range consists of 3xd IKZ, 5xd IKZ and 5xd without IKZ
- **Nano-U² high-performance coating**
  The outstanding performance coating for all-purpose drilling in steel
- **Greater process security, longer tool life and reduced production costs**
  Thanks to our in-house developed coating concepts and dimension-specific cutting edge design

SUPRADRILL® U

x-tap thread cutting tools

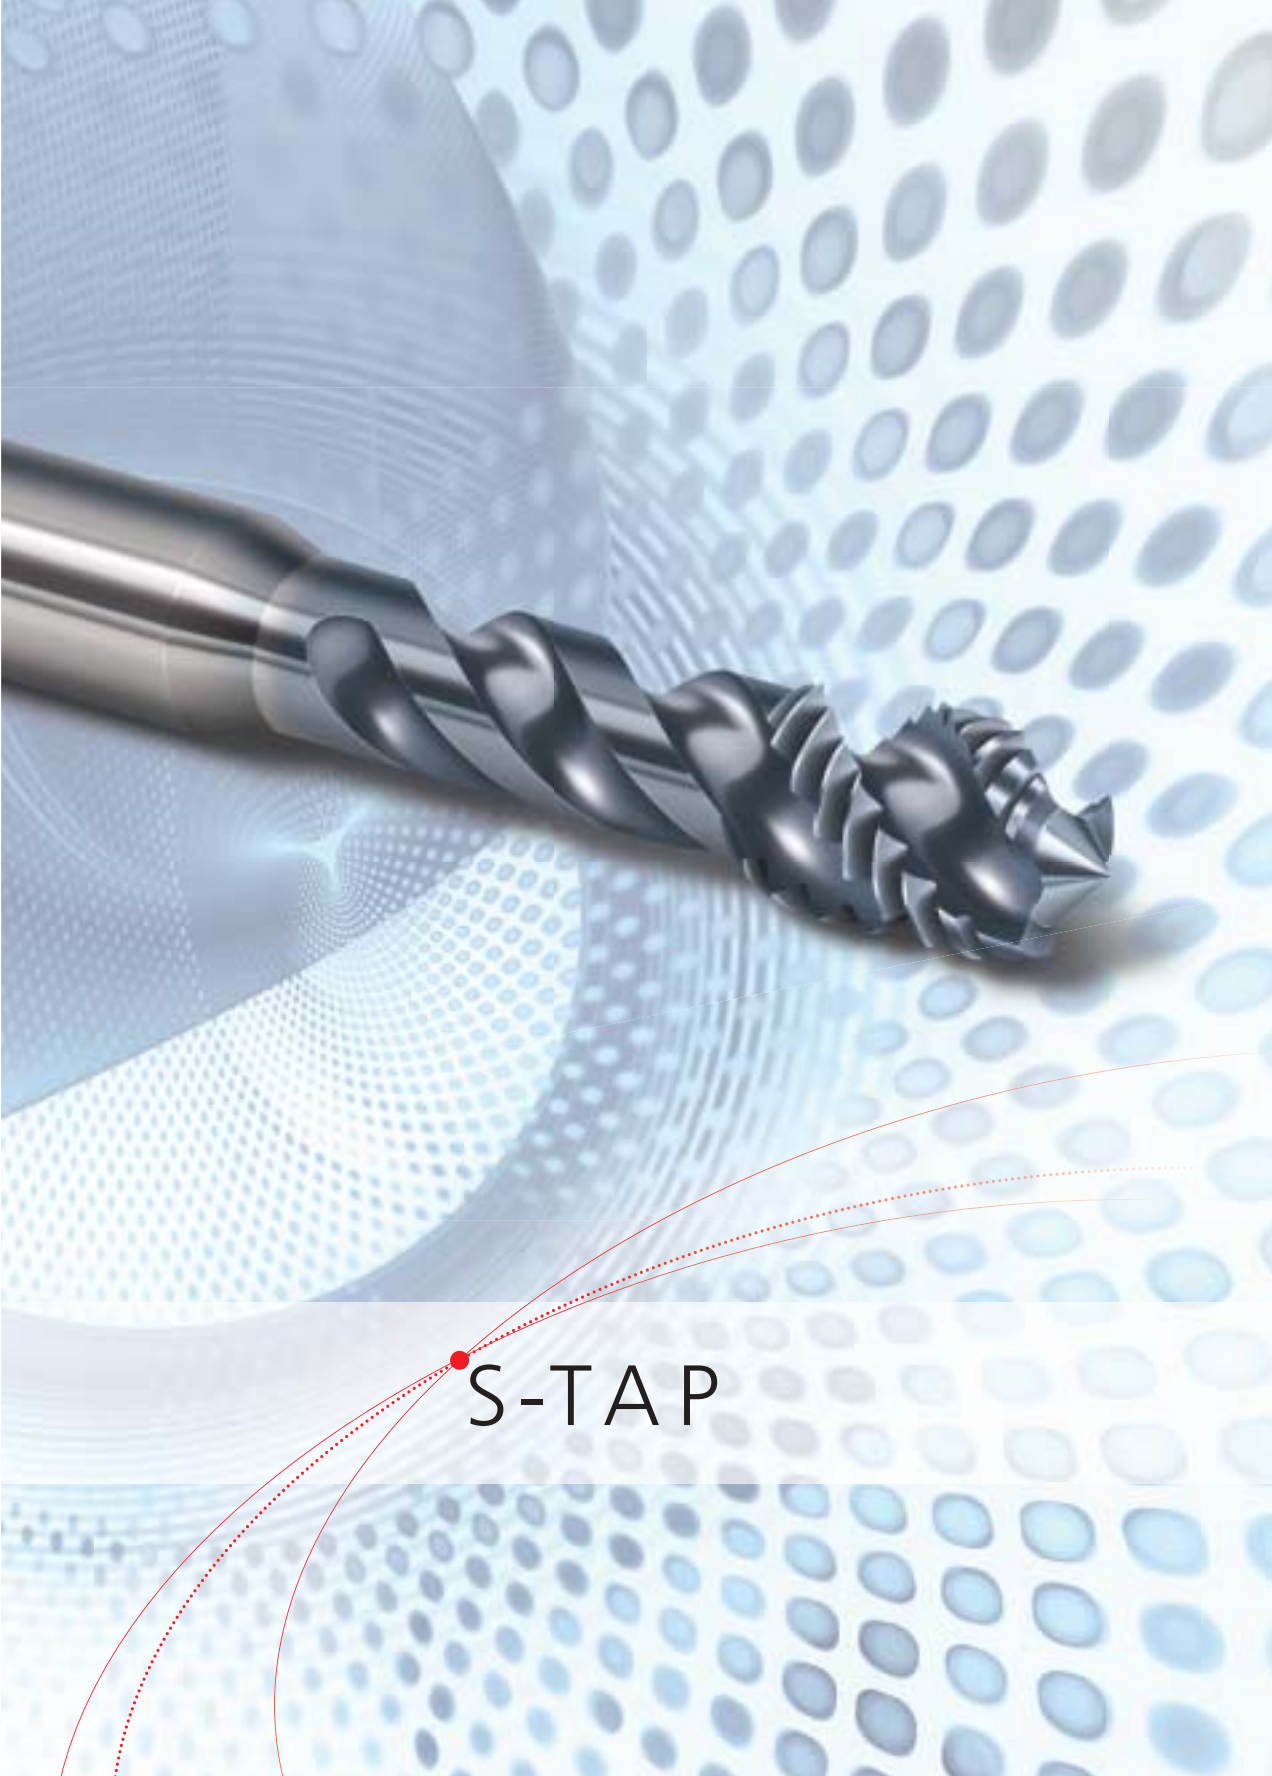
- **Thread cutting tools for high-performance tapping of steel and stainless steel**
- **Outstanding process security at low torque and with long tool life**
- **Numerous thread formats available for a broad range of applications**
  With a coding system for the safe, reliable selection of tools and application data
- **TRIBO hard coatings**
  For reliable tapping in stainless steel



X-TAP

s-tap thread cutting tools

- **The new performance benchmark for universal tapping of steel**
- **Outstanding process security, long tool life and optimisation capability**
  Thanks to a new substrate, deburring process, dimension-specific cutting edge conditioning and TiCN high-performance coating
- **Comprehensive metric and pipe thread assortment**
  For tapping steel, even in the lower strength range
- **Rigid tapping and length compensation**



S-TAP

u-tap thread cutting tools

- **Taps for universal use**
- **The use of state-of-the-art technologies makes it possible to tap a variety of different materials**
  Suitable for steel, Al wrought alloys, stainless steel
- **Outstanding process security and reduced manufacturing costs**
  Through optimal cutting edge design and universal application

U-TAP

Legend to the product page of drilling tools

Tool technologies

Drilling tools with four chamfers (Two friction and two guide lands)
- Improved straightness of the hole
- Improved hole quality and alignment
- Less deviation of the hole when drilling through cross holes
- Precise holes with good surface and maximum support of the tool upon exit

Drilling tool with optimised polished flutes and internal cooling
- Reduction of friction and therefore less adhesion, improved chip formation and lower heat generation

Drilling tool with optimised polished flutes, without internal cooling
- Reduction of friction and therefore less adhesion, improved chip formation and lower heat generation

Drilling tool with shank of h5 tolerance
- High concentricity and roundness
- Optimal for modern precision chucks

Cutting tool substrate material

HM XA

Fine grain carbide. Hardness 1950 HV. Co content 8%. Characterised by a particularly high level of abrasion resistance.

HM MGX

High-performance fine grain carbide with ultrafine tungsten carbides. Hardness 1610 HV. Co content 10%.

HM MG10

Fine grain carbide. Hardness 1600 HV. Co content 10%.

HM MGD²

Fine grain carbide with high bending and shear strength combined with good elasticity.

HM

Universal fine grain carbide.

HSS

High-performance substrate material, conventionally melted HSS alloy.

Legend to the product page of drilling tools

Internal cooling

Drills with internal cooling show improved chip formation and better chip removal which in turn results in an improved tool life.

Drills without internal cooling.

Point angle and helix angle

The point angle influences decisively the spectrum of materials that can be drilled. Further, small point angles bring a better centering behaviour; large point angles reduce the torque.

The helix angle influences decisively the rake angle on the major cutting edge (drill point) of the drill. Therefore, large helix angles are used for soft materials, small helix angles for hard and brittle materials.

Versions and dimensions of spiral flute drills

Spiral flute drills carbide, 3xd
The dimensions of this tool correspond to DIN 6537 K «Spiral flute drills carbide with offset cylindrical shank».

Spiral flute drills carbide, 5xd
The dimensions of this tool correspond to DIN 6537 L «Spiral flute drills carbide with offset cylindrical shank».

Spiral flute drills carbide and deep hole drills carbide, greater than 5xd
According to company standard.

Spiral flute drills carbide 8xd, optimised
According to company standard, but with optimised l/d ratio for optimum tool stability.

Special versions and dimensions

90°

Indication of the point angle for center drills or counterbores.
Counterbores 90° to DIN 335

Drilling depths

Indication of the nominal drilling depth. (Example: 5xd: five times drill diameter).
The nominal drilling depth does not correspond to the maximum depth! The maximum drilling depth is specified under L_{max}.

Legend to the product page of drilling tools

Shape of the shank / Shank versions

Full carbide tools with a cylindrical shank: shank version in accordance with DIN 6535 HA

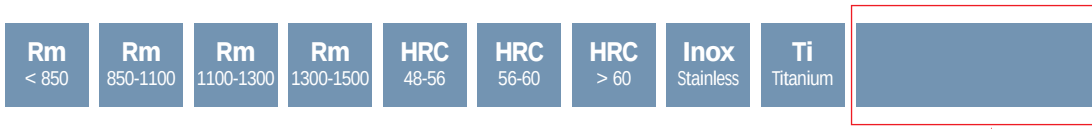
Full carbide tools with a cylindrical shank and a side clamping surface. Shank version in accordance with DIN 6535 HB

Carbide Micro drills and Deep hole drills with cylindrical shank: Shank design to company standard.

Application suitability

A blue background means that the tool is particularly suitable for this material.

A light blue background means that the tool has good to adequate suitability for this material.



Additional material which can be machined is stated in the additional field

Abbreviations

d_1	Diameter of the cutting edge [mm]
d_2	Diameter of the shank [mm]
d_3	Face-surface diameter on rose countersinks [mm]
l_1	Total length of the tool [mm]
l_2	Length of the chip groove [mm]
l_3	Length of the 2nd step (Step drills) [mm]
l_4	Length of the shank [mm]
L_{max}	Maximum drilling depth of the tool
L_K	Drill depth for chamfered edge (Step drills)

Lubrication and coolant pressure

Basically, when drilling work with lubricant. The goal is more efficient chip removal and heat reduction. Hardened steel or abrasive materials can be cooled by using air or treated with MQL (minimal quantity lubrication).

If the coolant is applied externally, ensure the correct positioning of the coolant jet. This should be in the flute (directed parallel to the helix angle) and the entrance to the hole.

The use of internal cooling (internal coolant supply) can increase tool life. It is necessary, depending on the tool diameter, to apply a minimum coolant pressure.

The following table provides a guideline for the recommended Fraisa coolant pressure for IKZ drills:

Required coolant pressure for spiral flute drills with internal coolant emulsion						
Versions	< ø 3 mm	ø 3-5 mm	ø 5-8 mm	ø 8-12 mm	ø 12-16 mm	ø 16-20 mm
up to 5xd	60 bar	50 bar	30 bar	25 bar	20 bar	15 bar
8xd – 30xd	80 bar	60 bar	40 bar	30 bar	25 bar	20 bar
Required coolant pressure for spiral flute drills with internal coolant/MQL (minimal quantity lubrication)						
Versions	< ø 3 mm	ø 3-5 mm	ø 5-8 mm	ø 8-12 mm	ø 12-16 mm	ø 16-20 mm
up to 5xd	12 bar	10 bar	9 bar	8 bar	8 bar	7 bar
8xd – 30xd	14 bar	12 bar	10 bar	9 bar	9 bar	8 bar

Concentricity

The concentricity of the drilling process is an important process influencing variable. The eccentricity should be as small as possible, as this greatly influences the development of tool wear. The rotation should be controlled especially for hole diameters less than 6 mm. The control measurement is made when the drilling tool is in the clamped condition and in the machine spindle.

The following table provides a guideline from Fraisa for the recommended maximum eccentricity:

Maximum eccentricity of spiral flute drills						
Diameter range	< ø 1 mm	ø 1-3 mm	ø 3-6 mm	ø 6-10 mm	ø 10-16 mm	ø 16-20 mm
Maximum eccentricity	3 µm	5 µm	10 µm	15 µm	20 µm	25 µm

Centering and pilot hole

Drilling tools must always be set at right angles to the workpiece. If drilling is required on an inclined surface, an addtional machining operation may be necessary to align the workpiece surface at a right angle to the drilling tool.

The point angle of the center drill should always be larger than the point angle of the subsequent spiral flute drill. Thus, an optimum centering of the drill and lower development of tool wear is achieved.

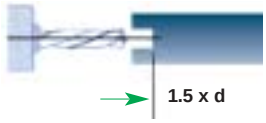
The following recommendation is from Fraisa for centering and pilot holes:

Versions	Cutting material	Recommendation
up to 5xd	Carbide	No
up to 5xd	HSS	Yes
8xd	Carbide	Optional. An improvement of positonal accuracy can be achieved by centering.
12xd – 30xd	Carbide	Yes, a pilot hole is required (see page 428)

Technical notes regarding use of deep hole drills

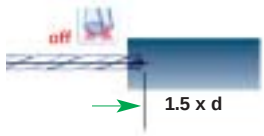
Fraisa SA recommends the following drilling strategy to increase both service life and reliability:

Step 1



Pilot hole = 1.5 x d.
e.g. Supradrill® U 3xd. B62011.
The pilot hole must be free of chips prior to insertion of the deep-hole drill!

Step 2

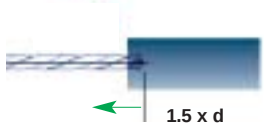


Insert the tool into the hole at max. 300 1/min
and v_f = 1000mm/min.
Without cooling up to 1 mm from the bottom of the pilot hole.

Step 3

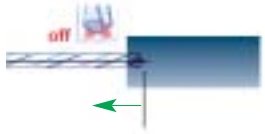
Coolant supply on.
Drill using recommended cutting data and without chip breaking.
When drilling **through-holes**, reduce the feed rate by at least 25% before retracting from the hole.

Step 4



Retract the deep-hole drill with double the feed rate (=2 x v_f) – until 1.5 x d after entering the hole. Position as stated in Step 2.

Step 5



Next reduce the spindle speed to max. 300 1/min.
Coolant feed is switched off.
Withdraw the drill from the drilled hole. (max. 1000 mm/min).

SAFETY NOTE

Outside of the drill hole, long deep-hole drills may only turn at a low speed (max. 300 1/min).
Higher spindle speeds can cause such tools to vibrate, leading to spontaneous failure.

Calculation formulas for cutting data

d_1	Diameter of the cutting edge [mm]
v_c	Cutting speed [m/min]
f	Feed per rotation [mm]
n	Spindle speed [min^{-1}]
v_f	Feed rate [mm/min]
Q	Material removal rate [cm^3/min]
T	Primary processing time for the maximum drill depth of the tool [sec]
L	Effective drill depth [mm]

Spindle speed	$n = \frac{v_c \cdot 1000}{d_1 \cdot \pi}$	$\left[\frac{1}{min}\right]$
Cutting speed	$v_c = \frac{d_1 \cdot n \cdot \pi}{1000}$	$\left[\frac{m}{min}\right]$
Feed rate	$v_f = f \cdot n$	$\left[\frac{mm}{min}\right]$
Material removal rate	$Q = \frac{d_1^2 \cdot \pi \cdot v_f}{4 \cdot 1000}$	$\left[\frac{cm^3}{min}\right]$
Primary processing time	$T = \frac{L}{v_f} \cdot 60$	$\left[sec\right]$

Legend to the product page of thread cutting tools

Thread types

M	Metric coarse thread according to ISO DIN 965 (DIN 13)
MF	Metric fine thread according to ISO DIN 965 (DIN 13)
MJ	MJ thread for aerospace use according to DIN ISO 5855
G	Whitworth pipe thread according to DIN ISO 228
UNC	Unified coarse thread according to ASME B1.1
UNJC	Unified coarse thread according to SAE AS 8879
UNF	Unified fine thread according to ASME B1.1
UNJF	Unified fine thread according to SAE AS 8879
NPT	Conical american coarse thread according to ANSI B1.20.1
NPTF	Conical american coarse thread according to ANSI B1.20.3
EG M	Metric coarse thread for inserts according to DIN 8140-2

Legend to the product page of thread cutting tools

Application classes / Tolerance positions

ISO 2 (6H)	Tools of application class 2 (ISO 2) are designed for the production of threads with the tolerance fields 4G, 5G, 6H.
ISO 1 (4H)	Tools of application class 1 (ISO 1) are designed for the production of threads with the tolerance fields 4H, 5H.
ISO 3 (6G)	Tools of application class 3 (ISO 3) are designed for the production of threads with the tolerance fields 6G, 7H, 8H.
7G	Tools of application class 7G are preventively designed for the production of threads with the tolerance fields 7G, 8G, where subsequent heat treatment may cause dimensional distortions.
ISO 2 +0,1	Tools of application class 2 (ISO 2) are designed for the production of threads with the tolerance fields 4G, 5G, 6H. For threads which will get a galvanic coating of 0.025 mm thickness the tools are designed with an increased thread tolerance of 0.1 mm.
4H	Tools of application class 4H are designed for the production of threads MJ with the tolerance field 4H (ASME B1.1).
2B	Tools of application 2B are designed for the production of threads with the tolerance field 2B.
3B	Tools of application 3B are designed for the production of threads with the tolerance field 3B.
6H mod	Tools of application 6H are designed for the production of threads for inserts.

Cutting tool substrate material

HSS PM/F	High-performance cutting tool substrate material, powder metallurgically produced HSS alloys.
HSS-E Co5	High-performance substrate material, conventionally melted HSS alloy. Co-content 5%.
HM MG10	Universal fine-grain carbide. Hardness 1600 HV. Co-content 10%.
HM	Universal fine-grain carbide.

Legend to the product page of thread cutting tools

Thread norm

The teeth profiles of the tool correspond to the specified norm (see «Thread types»).

Form of the shanks

Cylindrical shank execution according to the specified tool norms.

Cylindrical shank execution with flat according to the specified tool norms.

Cylindrical shank execution with square end according to the specified tool norms.

Cylindrical shank execution with square end similar to the specified tool norms.

Cylindrical shank execution with square end.

Bore forms

The thread core bore must have the correct diameter.
(General rule for threading: bore diameter = thread diameter - pitch)

The tool is suitable for the fabrication of blind hole threads.

The tool is suitable for the fabrication of through hole threads.

The tool is suitable for the fabrication of blind hole and through hole threads.

The tool is suitable for the production of conical through and blind hole threads.

Legend to the product page of thread cutting tools

Chamfer forms / Lead-in cone forms

Chamfer form for taps according to DIN 2197, table 4, type B. The pitch number in the chamfer is between 3.5 and 5.

Chamfer form for taps according to DIN 2197, table 4, type C. The pitch number in the chamfer is between 2 and 3. Lead-in cone form for thread former according to DIN 2175, table 4: type C. The length of the lead-in cone is between 2 to 3 times the pitch.

Lead-in cone form for thread former according to DIN 2175, table 4: type E. The length of the lead-in cone is at most double the pitch.

Chip flow

Tool with chip flow in feed direction.

Tool with chip flow against the feed direction.

Tool for short chipping work piece materials.

Cold forming taps

Tool with polygon profile without lubrication grooves.

Tool with polygon profile with lubrication grooves.

Thread milling cutters

The tool is suitable for the fabrication of internal threads.

The tool is suitable for the fabrication of external threads.

Legend to the product page of thread cutting tools

Application suitability

A blue background means that the tool is particularly suitable for this material.

A light blue background means that the tool has good to adequate suitability for this material.

Rm	Rm	Rm	Rm	HRC	HRC	HRC	Inox	Ti

Additional material which can be machined is stated in the additional field

Cooling lubricants

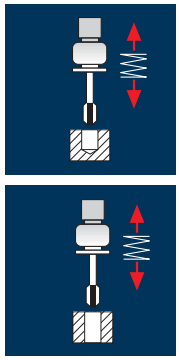
For the process of thread cutting and in particular for thread forming a good lubrication is essential. Especially for deeper threads proper lubrication is very important.

Best results for threading can be achieved by using oil (lubrication effect). The machining with an emulsion of at least 5% is also possible.

Oil must be used as lubricant.

Oil with special additives must be used as lubricant.

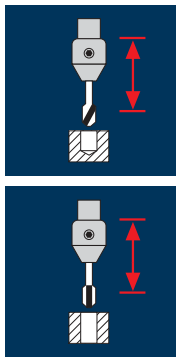
Choose diameter of the drill hole according to column critical material on page 445.



Thread cutting with functional performance of the compensation chuck

A satisfactory compensation function of the chuck must be guaranteed (no jamming). Otherwise, despite the chuck, the thread may be miscut or pitch errors can arise. The torque level of the compensation chuck must be selected according to the thread type and the work piece material.

Programming of a too high RPM value can lead to problems. If a RPM is selected which cannot be reached (due to the inertia of the spindle), the result may be premature breakage of the tool or miscutting of the thread. A careful analysis often shows that high spindle speeds do not lead to overall significant time savings.

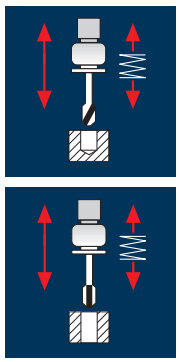


Rigid Tapping

Rigid tapping is designed for modern machines with synchronised spindle drives. All tools have a clamping flat and are used with conventional chucks.

When using Rigid tapping, a sufficient approach distance must be programmed. If the distance is too small, the machine spindle may not be able to properly synchronize with the feed before entering the drillhole. This will result in a pitch error of the thread, even with synchronous working.

For some machines, it is possible that the recommended spindle speed for synchronous operation cannot be reached. In these cases it is necessary to operate at the highest possible spindle speed where synchronism of the machine is still guaranteed.



Thread cutting with functional performance of the compensation chuck or Rigid Tapping

Technical notes regarding use of thread cutting tools

Hardness increase during drilling
For drilling, care has to be taken to ensure that a sharp, intact drill is used. If the wear is already too great, there is a risk that hardening of the periphery will occur during drilling. One result of this hardening may be the tap breaking.

Age or precipitation hardening and upsetting the countersink
When preparing for tapping, quality tools should be used which are adapted to the material. If the counterbore is too worn, the countersink will harden or be upset. This means the tap will encounter problems as soon as it starts to cut. This can lead to breakage right at the beginning. The countersink is important in guiding the tap.

Deeper threads
For deep threads, tools must be chosen with sufficiently long flutes. There is otherwise a risk of tool breakage due to chip build-up, because the chips cannot flow out of the hole. With Rigid Tapping, pecking in several steps can be programmed, in order to shorten the chips. Sufficient cooling is important.

Functional performance of the compensation chuck
A satisfactory compensation function of the chuck must be guaranteed (no jamming). Otherwise, despite the chuck, the thread may be miscut or pitch errors can arise. The torque level of the compensation chuck must be selected according to the thread diameter.

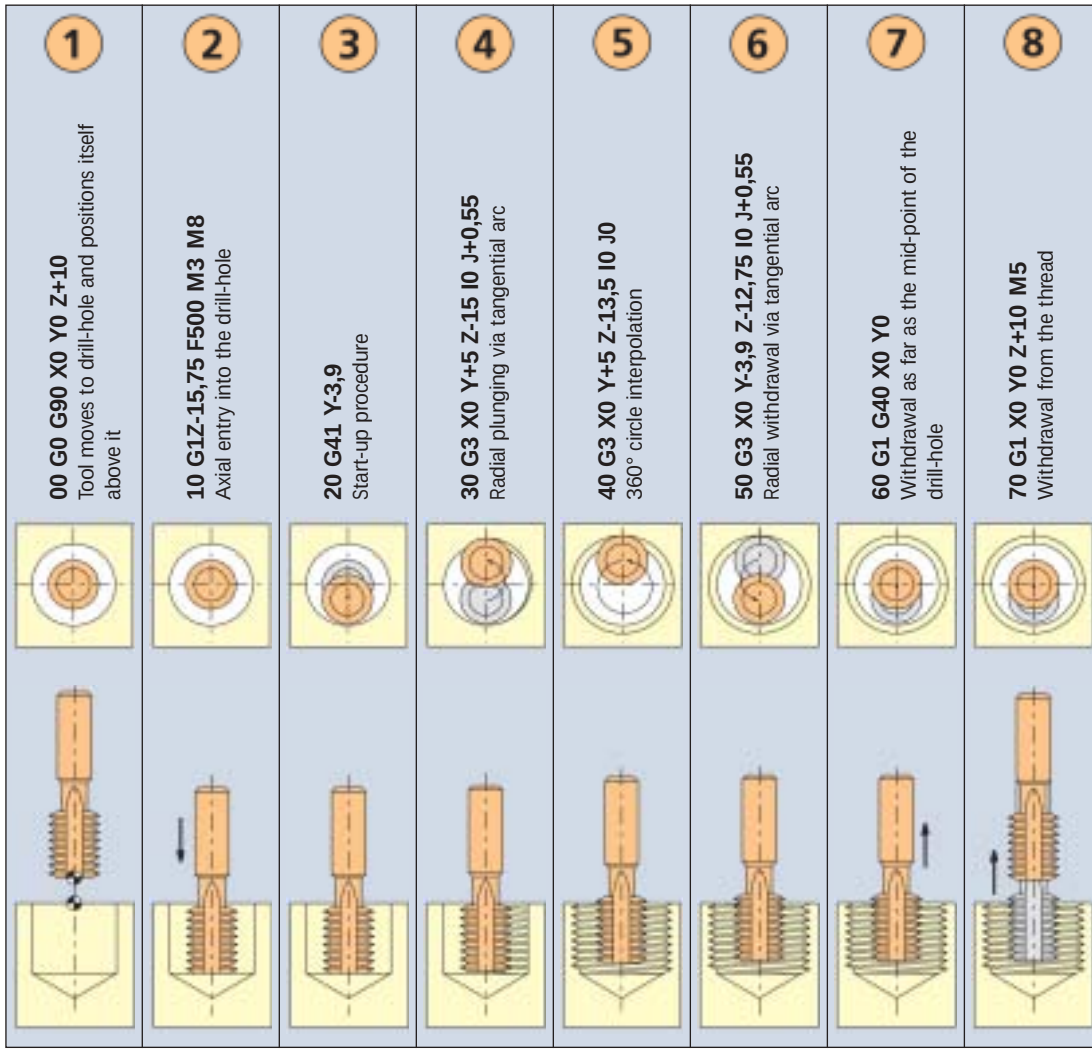
Correctly adjusted coolant jet
A specifically aimed coolant jet is important in tapping work. The direction should be from above, in the direction of the flutes, so that the cooling is also effective at depth. If the coolant jet is not aimed, the problem of heat development in the drillhole arises, with the risk of cold welding-together of the material, which in turn may lead to reduced service life and poor chip formation.

Safety clearance
When using Rigid Tapping, a sufficient approach distance must be programmed. If the clearance is too small, the problem arises of the machine spindle not synchronising with the feed before entering the drillhole. This results in pitch error of the thread, even with synchronous working.

Suitability of the machine
On a number of machines, there is a possibility that the recommended RPM cannot be applied. In this case, the RPM of the machine should be programmed accordingly.

Inconstant RPM
Programming too high RPM can lead to problems: if a RPM is selected which cannot be achieved (due to the inertia of the machine), the result may be premature breakage of the tool or miscutting of the thread. If observed closely, it may often be seen that a high RPM does not in fact produce the time saving which was intended.

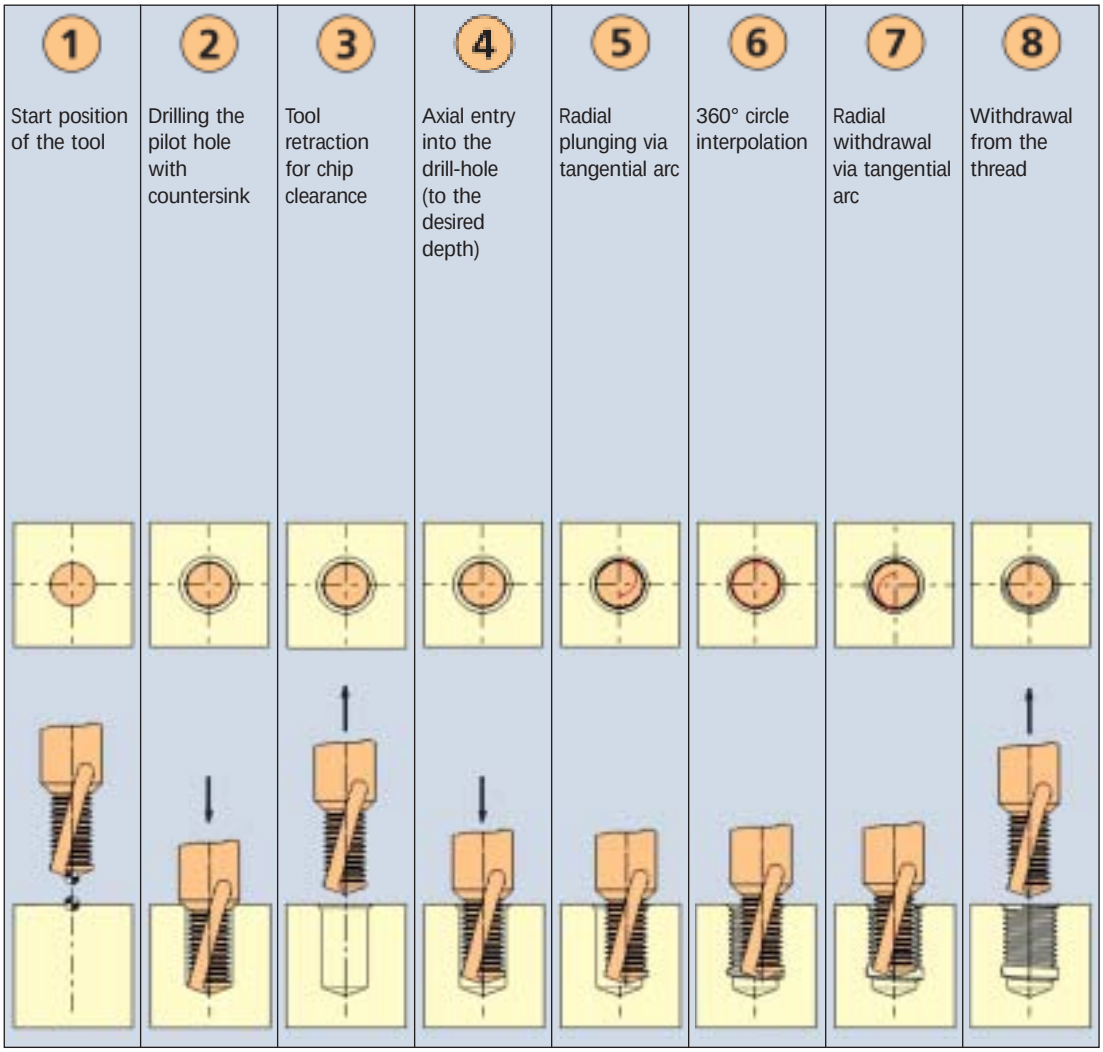
Thread milling cycle for M10 in ISO-code as an example



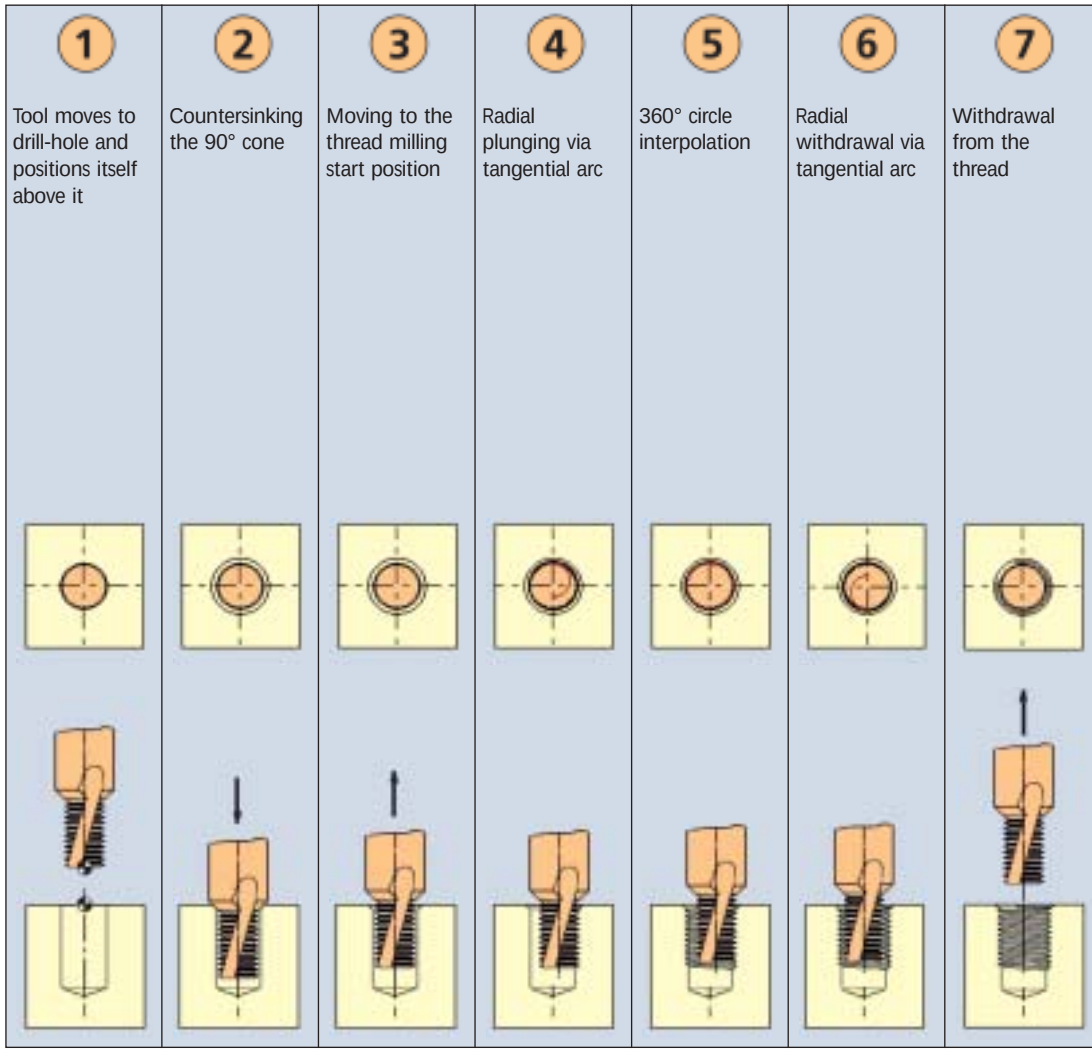
Meaning of the G and M commands used

G0	G1	G3	G40	G41	G90	G91	M3	M5	M8	M9
Linear motion at high speed	Linear motion with feed F in mm/min	Circular arc interpola-tion with mid-point (I, J)	Cancel too-radius correction	Tool-radius correction (tool to left of contour)	Absolute-measure-ment pro-gramming	Sequential-measure-ment pro-gramming	Spindle on (right-handed motion)	Spindel off	Cooling on	Cooling off

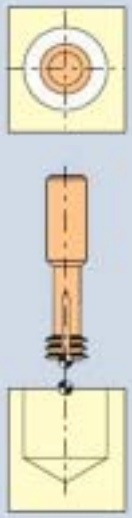
Thread milling cycle for drill / thread milling

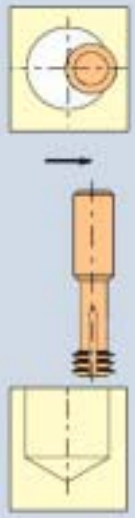


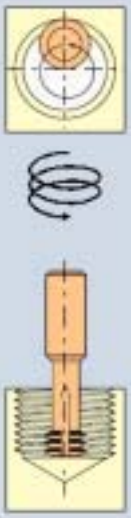
Thread milling cycle for thread milling cutter with chamfer

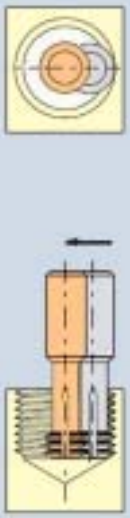


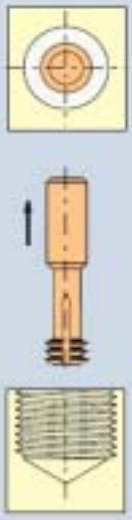
Thread milling cycle for right-handed thread (counter-clockwise-rotating) with thread whirler

1	2	3	4	5
Tool moves to drill-hole and positions itself above it	Radial infeed	Generate thread using helical interpolation (to the desired depth)	Radial retraction	Withdrawal from the thread
				


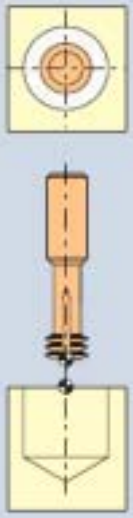


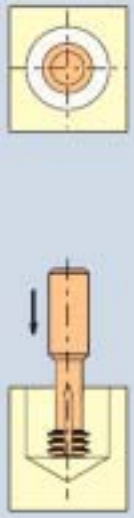


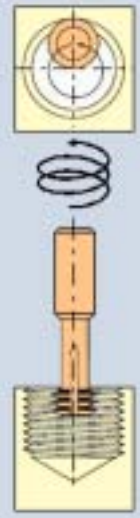


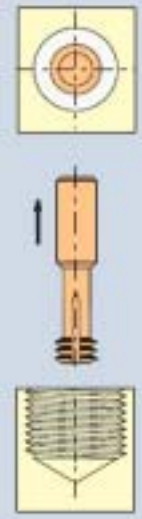


Thread milling cycle for right-handed thread (clockwise-rotating) with thread whirler

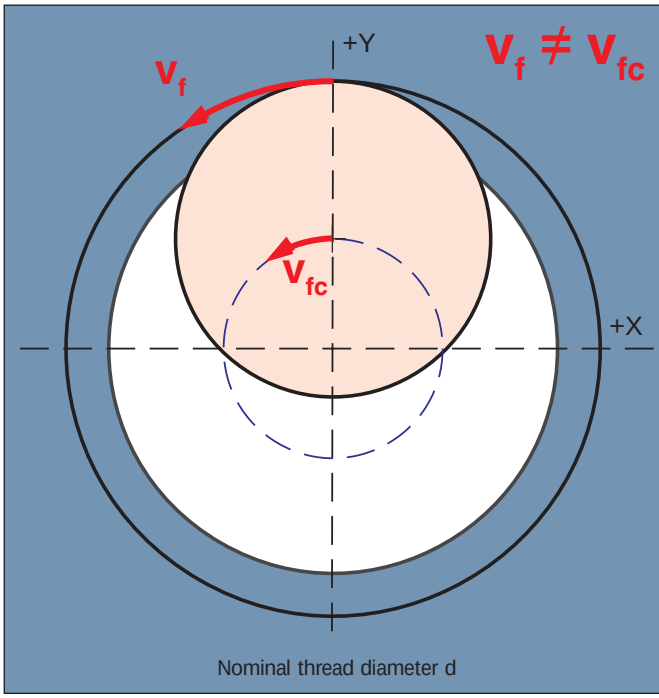
1	2	3	4	5
Tool moves to drill-hole and positions itself above it	Axial entry into the drill-hole (to the desired depth)	Radial plunging via tangential arc	Generate thread using helical interpolation	Withdrawal from the thread
				






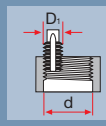


Specifying the feed speed



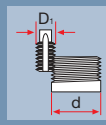
Conversion from feed v_f on the workpiece to the programming feed v_{fc} which is the feed in the tool centre:

For internal threads



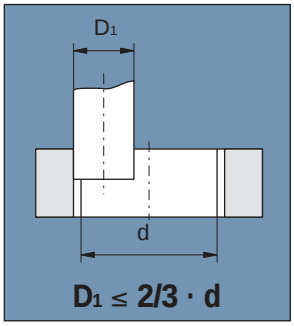
$$v_{fc} = \frac{v_f \cdot (d - D_1)}{d}$$

For external threads



$$v_{fc} = \frac{v_f \cdot (d + D_1)}{d}$$

Avoiding profile distortions



In order to avoid profile distortions, the diameter of the thread milling cutter D1 must not exceed 2/3 of the nut core diameter d.

The overmeasure of the core drill-hole should be 0.1 to 0.3 mm.

The thread is thereby milled perfectly.

Formulas and abbreviations

a	Dimension of square end
d	Nominal diameter of the thread
d_1	Diameter of the shank
d_2	Drilling diameter of the drill / thread milling cutter
D_1	Diameter of the thread milling cutter
d/D_1	Ratio of diameters for the determination of the feed speed
Rk	Corrected milling cutter radius for ISO 2 (6H) thread tolerance (radius to be programmed in the machine control system)
f_z	Feed per tooth
l	Length of threaded section of the tap / thread former
l_1	Neck length of the tap / thread former or overall length of the thread milling cutter
l_2	Length of threaded section of the thread milling cutter
l_3	Flute length of the tap or neck length of the thread milling cutter
L	Overall length of the tap / thread former
L_K	Countersinking depth of the thread milling cutter with chamfer
n	Spindle speed
P	Thread pitch
v_c	Cutting speed
v_f	Feed rate
v_{fc}	Feed speed in the tool centre
	Number of flutes on the tap and thread cutter
	Number of form edges of cold forming taps
Δ	Diameter differences of the thread flank, the thread outside and the thread core in the application class 2 (ISO 2) according to DIN 22857
R_m	Mechanical tensile strength
HRC	Hardness according to Rockwell C
HV	Hardness according to Vickers
HB	Hardness according to Brinell

Spindle speed

$$n = \frac{v_c \cdot 1000}{d_1 \cdot \pi} \quad \left[\frac{1}{min}\right]$$

Cutting speed

$$v_c = \frac{d \cdot \pi \cdot n}{1000} \quad \left[\frac{m}{min}\right]$$

Feed rate

$$v_f = P \cdot n \quad \left[\frac{mm}{min}\right]$$

General conditions

1. General

1.1 The contract is concluded with the written confirmation (Order confirmation) of Fraisa SA or its subsidiaries (hereinafter known in short as «supplier») that it accepts the order.

1.2 Any deviation from the order in the order confirmation forms part of the contract, unless the purchaser rejects it in writing within 5 working days from the receipt date of the order confirmation. Quotations, particularly those involving price lists, brochures, etc., which contain no acceptance dates, are non-binding.

1.3 These delivery conditions shall be binding if they are declared as applicable in the quotation or order confirmation. Other conditions of the purchaser are only applicable if they have been expressly accepted by the supplier and this acceptance is in writing.

1.4 All agreements and legally relevant declarations of the parties need to be made in writing in order to be applicable.

1.5 If any provision of these delivery conditions should prove wholly or partially ineffective, the parties shall replace this provision with a new agreement which comes as close to the intended legal and economic outcome as possible.

2. Scope of the delivery and services

The supplier's deliveries and services are itemised in the order confirmation, including any appendices to it. The supplier is authorised to make changes that lead to improvements, where these do not increase the price.

3. Brochures, catalogues and technical documents

Brochures and catalogues are not binding without other agreements. Information contained in technical documents is only binding if it is explicitly assured.

4. Prices

4.1 All prices are - in the absence of any agreement - net prices, ex works, excluding packaging, in freely available Swiss Francs or the local currency of the subsidiaries, without any deductions.

4.2 All additional costs, e.g. for freight, insurance, export, import and other permits and certifications, shall be borne by the purchaser.

4.3 Likewise, the purchaser shall bear all taxes (especially VAT), levies, fees, duties (and the like) that are imposed in connection with the contract, or reimburse the supplier for them against corresponding proof, if the supplier has to pay for them.

5. Payment terms

5.1 The payments are to be made by the purchaser in accordance with agreed payment terms at the location of the supplier's office without the deduction of discounts, expenses, taxes, duties, fees, duties (and the like). The obligation to make payment is fulfilled, when at the location of the supplier's office, the arranged amount have been made freely available to the supplier. The payment deadline is 30 days from the invoice date.

5.2 The payment deadline and/or the separately agreed payment deadlines must be met even if the transport, delivery or acceptance of the delivery is delayed or prevented for reasons for which the supplier is not responsible, if non-essential items are missing from the delivery, or if subsequent machining is necessary which does not make usage of the delivery impossible.

5.3 If the purchaser does not make payment by the payment deadline and/or the separately agreed payment deadline, he must, without notice, pay interest from the date the invoice is due at an interest rate based on the rate where the purchaser has his office, however at least 4% above the discount rate of the Swiss National Bank. The right to claim further damages is reserved.

6. Retention of title

6.1 The supplier shall retain ownership of all parts of the delivery until he has received the payments in accordance with the contract.

6.2 The purchaser is obliged to participate in measures which are necessary for the protection of the supplier's property; in particular, at the expense of the purchaser, he authorizes the supplier to register or enter the title in public records, books and the like according to the relevant national laws and to comply with all relevant formalities.

6.3 The purchaser shall maintain the delivered goods at his cost for the duration of retention of title and insure them on behalf of the supplier against theft, breakage, fire, water and other risks. He shall further take all measures to ensure that the supplier's property claim is in no way compromised nor cancelled.

7. Delivery deadline

7.1 The supplier shall strive to meet the delivery deadline which is recorded in the order confirmation. The delivery deadline is met if the «ready for despatch» message is sent to the purchaser by its expiry.

7.2 The meeting of the delivery deadline presupposes full compliance with the contractual obligations by the purchaser.

7.3 The delivery deadline shall be extended by an appropriate period if hindrances occur which, despite due care, the supplier cannot avert, regardless of whether they originate from him, the purchaser or a third party. Such hindrances include epidemics, mobilisation, war, riots, major breakdowns, accidents, labour disputes, delayed delivery or mistakes in the delivery of the necessary raw materials and semi-finished products, governmental actions or omissions, and natural events.

7.4 If a specific date is agreed upon instead of a delivery deadline, this is equivalent to the last day of a delivery deadline. Points 7.1 to 7.3 apply analogously.

7.5 In the case of delay, the purchaser is not entitled to compensation or other benefits, except for the agreement cited in point 7 or an agreement stipulated in a separate agreement. This restriction does not apply to unlawful intent or gross negligence on the part of the supplier.

8. Packaging

Packaging is separately charged by the supplier and cannot be returned.

9. Transfer of benefits and risks

9.1 At the latest, benefits and risks are passed to the purchaser when the delivery leaves the factory.

9.2 If the shipment is delayed at the request of the purchaser or for other reasons which the supplier is not responsible for, the risk is passed to the purchaser for the originally scheduled date of delivery from the factory. From this point on, the supplied products are stored and insured at the purchaser's expense and risk.

10. Shipping, transportation and insurance

10.1 The supplier must be informed of special requests concerning shipping, transportation and insurance in good time. Transportation takes place at the purchaser's expense and risk.

10.2 Complaints relating to the shipping or transportation should be addressed to the last carrier by the purchaser without delay upon receipt of the delivery or the shipping documents.

10.3 Insurance against all kinds of damage is the responsibility of the purchaser.

11. Checking and acceptance of the delivery

11.1 The purchaser must check the delivery upon receipt within 8 days and notify the supplier of any defects within the same period in writing. Failing this, the supply shall be deemed approved.

11.2 The supplier shall resolve the defects which are notified to him in accordance with point 12.1 as quickly as possible, or - at his option - replace defective goods.

11.3 In the case of defects of any sort relating to the delivery, the purchaser has no rights or rights to make claims other than those specifically mentioned in points 12 and 13 (warranty, liability for defects).

12. Warranty, liability for defects

12.1 The warranty period is 6 months. It begins with the date the delivery leaves the factory. In the case of replaced or repaired products, the warranty period starts afresh and shall last for 6 months from the date the replacement goods are shipped from the supplier. The guarantee expires prematurely if the purchaser or a third party undertakes inappropriate modifications or repairs or if the purchaser, when a fault has occurred, does not immediately take all appropriate measures to mitigate the damage and does not give the supplier the opportunity to resolve the defect.

12.2 Damage is excluded from the warranty and the supplier's liability which has arisen in circumstances which cannot be proven to be due to poor materials, faulty design or poor workmanship, e.g. natural wear, improper maintenance, failure to follow operating instructions, excessive strain, unsuitable equipment, chemical or electrolytic influences as well as other reasons that the supplier cannot be held responsible for.

12.3 The purchaser shall only be entitled to the replacement or repair of defective goods. The purchaser is not entitled to further claims, especially for compensation for damage or consequential damage. In no case can claims be considered by the purchaser for compensation for damage which is not caused to the object itself, e.g. loss of production, inability to use the goods, loss of contracts, loss of profit and other direct or indirect damage. This disclaimer does not apply to unlawful intent or gross negligence on the part of the supplier. Moreover, this disclaimer does not apply in so far as any mandatory provisions oppose it.

13. Place of jurisdiction and applicable law

13.1 The place of jurisdiction for the purchaser and the supplier is the place where the supplier has its head office. The supplier is entitled to take out legal action against the purchaser at its place of residence.

13.2 The contract shall be exclusively governed by the national commercial law which applies in the supplier's country. The provisions of the CISG do not apply.
